

Can self-management support reduce health care utilisation without compromising patient outcomes?

Maria Panagioti and Peter Bower

Research question:

Can self-management support reduce health care utilisation without compromising patient outcomes?

Background

- Demand in the context of financial crisis
- Focus on efficiency in care delivery
- Self-management critical?

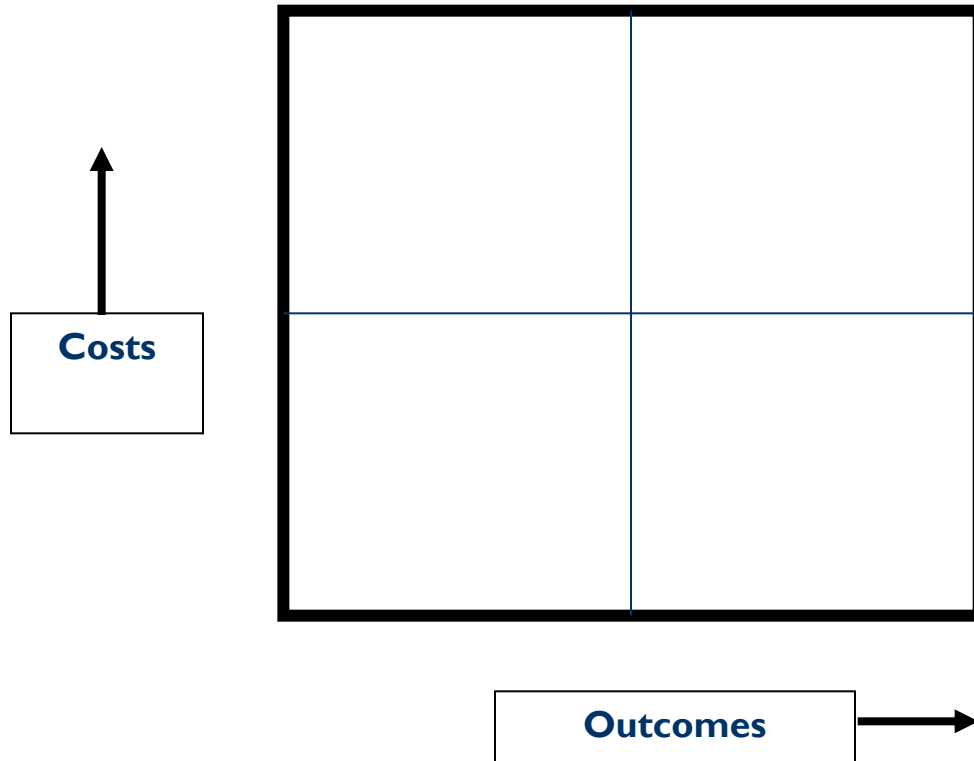

Caveats

- Magnitude and consistency of effects
- 'Reach'
- Cost effectiveness

Cost effectiveness

Cost effective

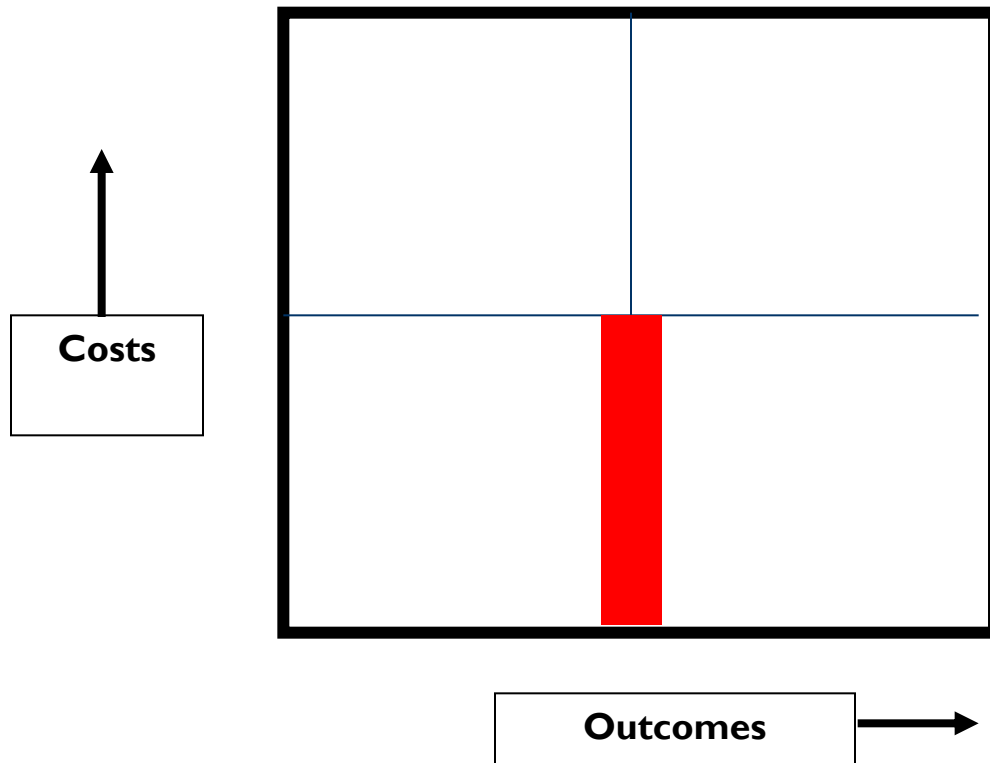

Technically efficient

Cost effective

Technically efficient

Aims

- To identify models of self-management associated with reductions in utilisation without compromising outcomes
- Make recommendations for commissioners and funders on self-management delivery and research priorities

Link

- PRISMS study (Taylor et al)
- Share ideas about scope of:
 - Typology of long term conditions
 - Typology of self management support

Definitions

- Long term conditions
 - ‘A condition that can not be cured but can be managed through medication and/or therapy’
- Self management support
 - A self-management support intervention is one primarily designed to develop the abilities of patients to undertake management of health conditions through education, training and support to develop knowledge, skills or psychological and social resources
- Across ‘pyramid’ of care
 - Pure self-management, guided self-management, case management

Review methods

- Search
 - Previous economic review (Richardson et al 2005), PRISMS review, Cochrane and other reviews
- Primary search for studies
 - York CRD search - 15,598 hits
- Eligibility
 - Long term condition, self management support, amenable to meta analysis

Varieties of self-management

Pure self-
management

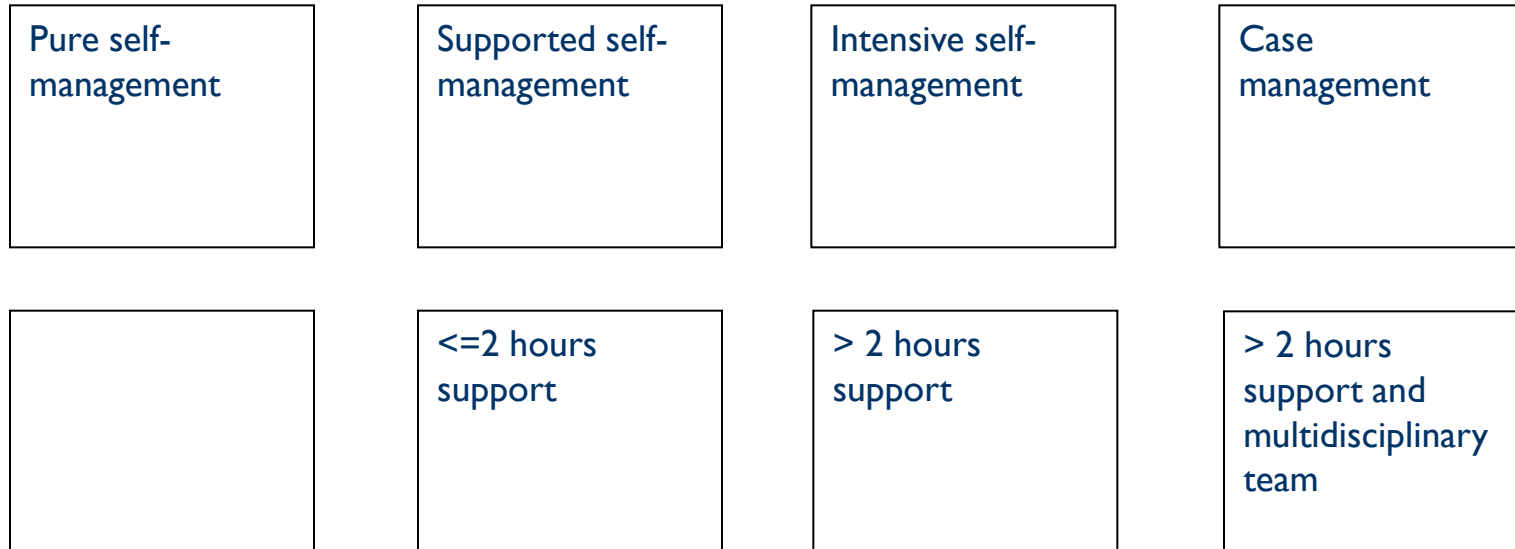

Supported self-
management

Intensive self-
management

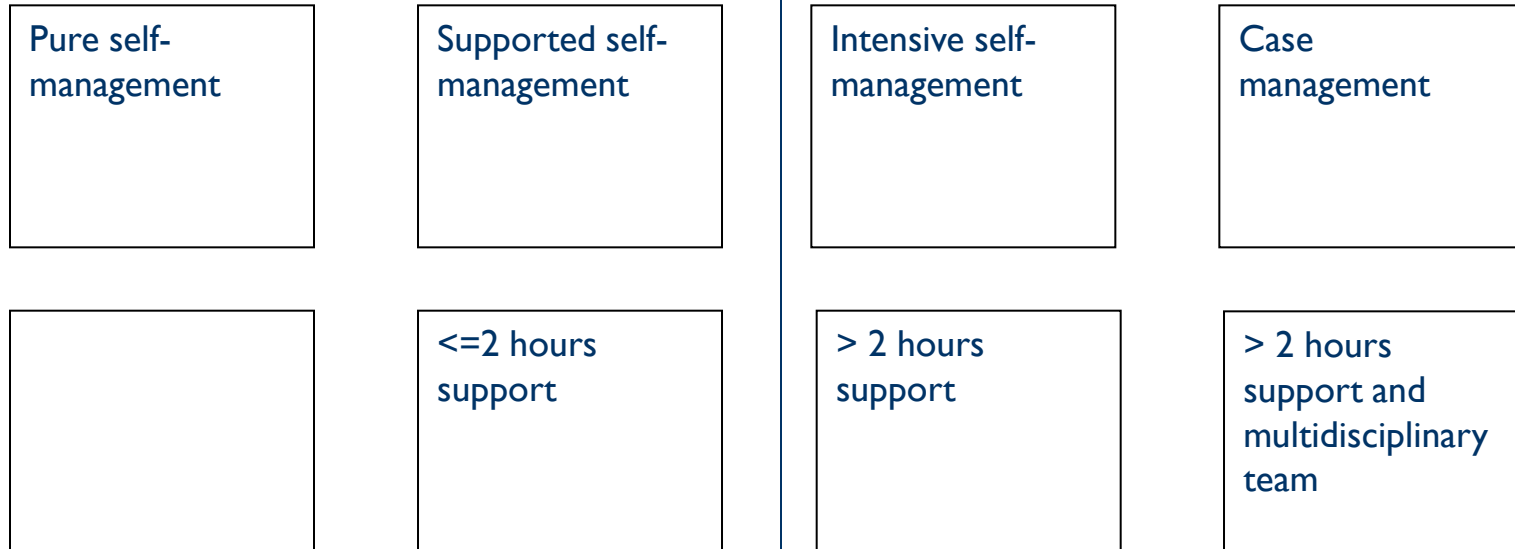

Case
management

Varieties of self-management

Varieties of self-management

By disease group

- Conventional categories
- Groupings
 - Variability over time (e.g. pain, depression, IBD)
 - Asymptomatic, management aimed at prevention (T2D, CKD)
 - Ongoing symptoms with exacerbations (COPD, CHD)
 - Ongoing symptoms with limited variability (OA, CFS)

Outcomes

- Quality of life in broadest sense
 - Self reported
 - Disease specific, generic, depression
 - Excluded 'clinical' outcomes (HbA1c)
- Costs
 - Total costs
 - Hospital costs

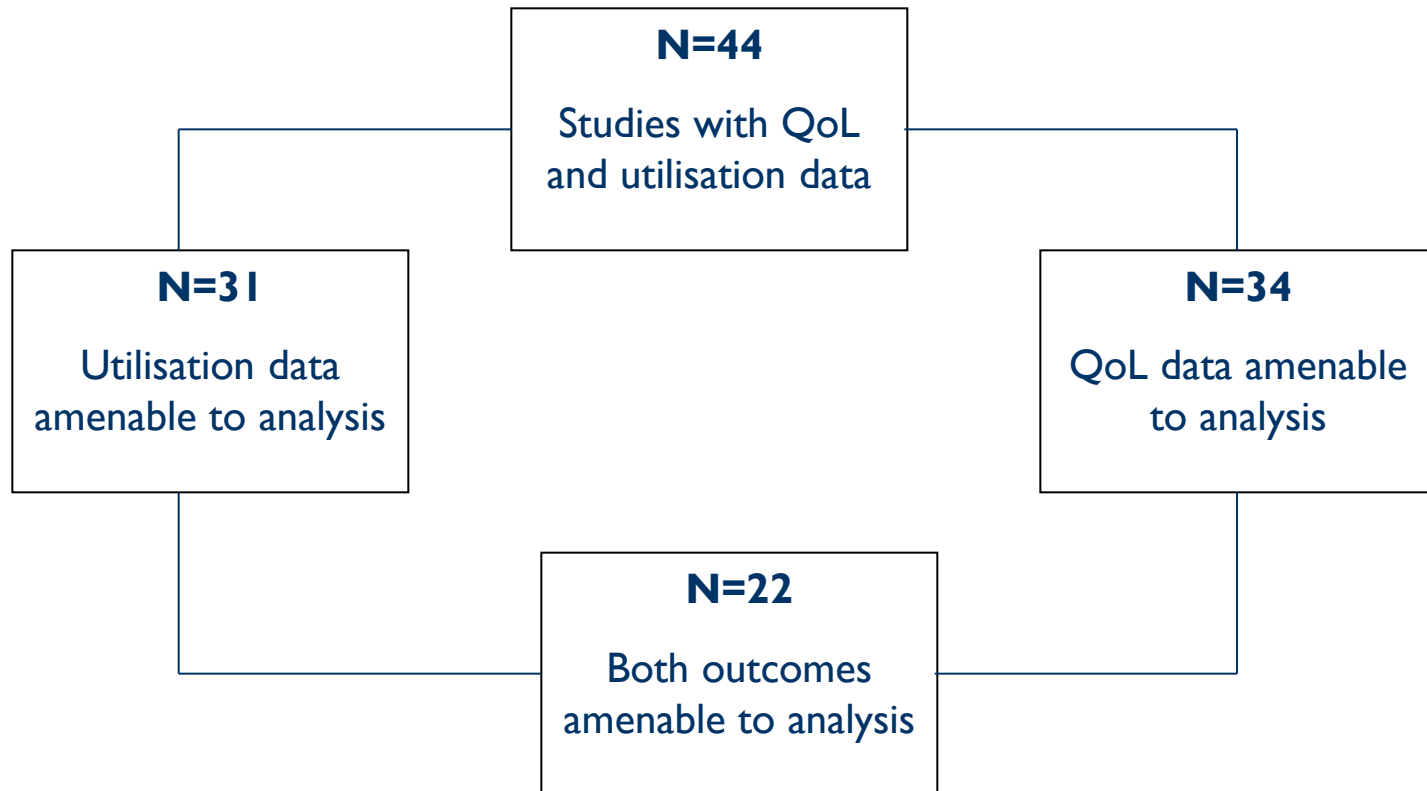

Analysis

- For each disease category
 - Calculate impact on quality of life and utilisation
 - Explore relationships between these outcomes
 - QoL and hospital costs, total costs
 - Explore effects by type of self-management

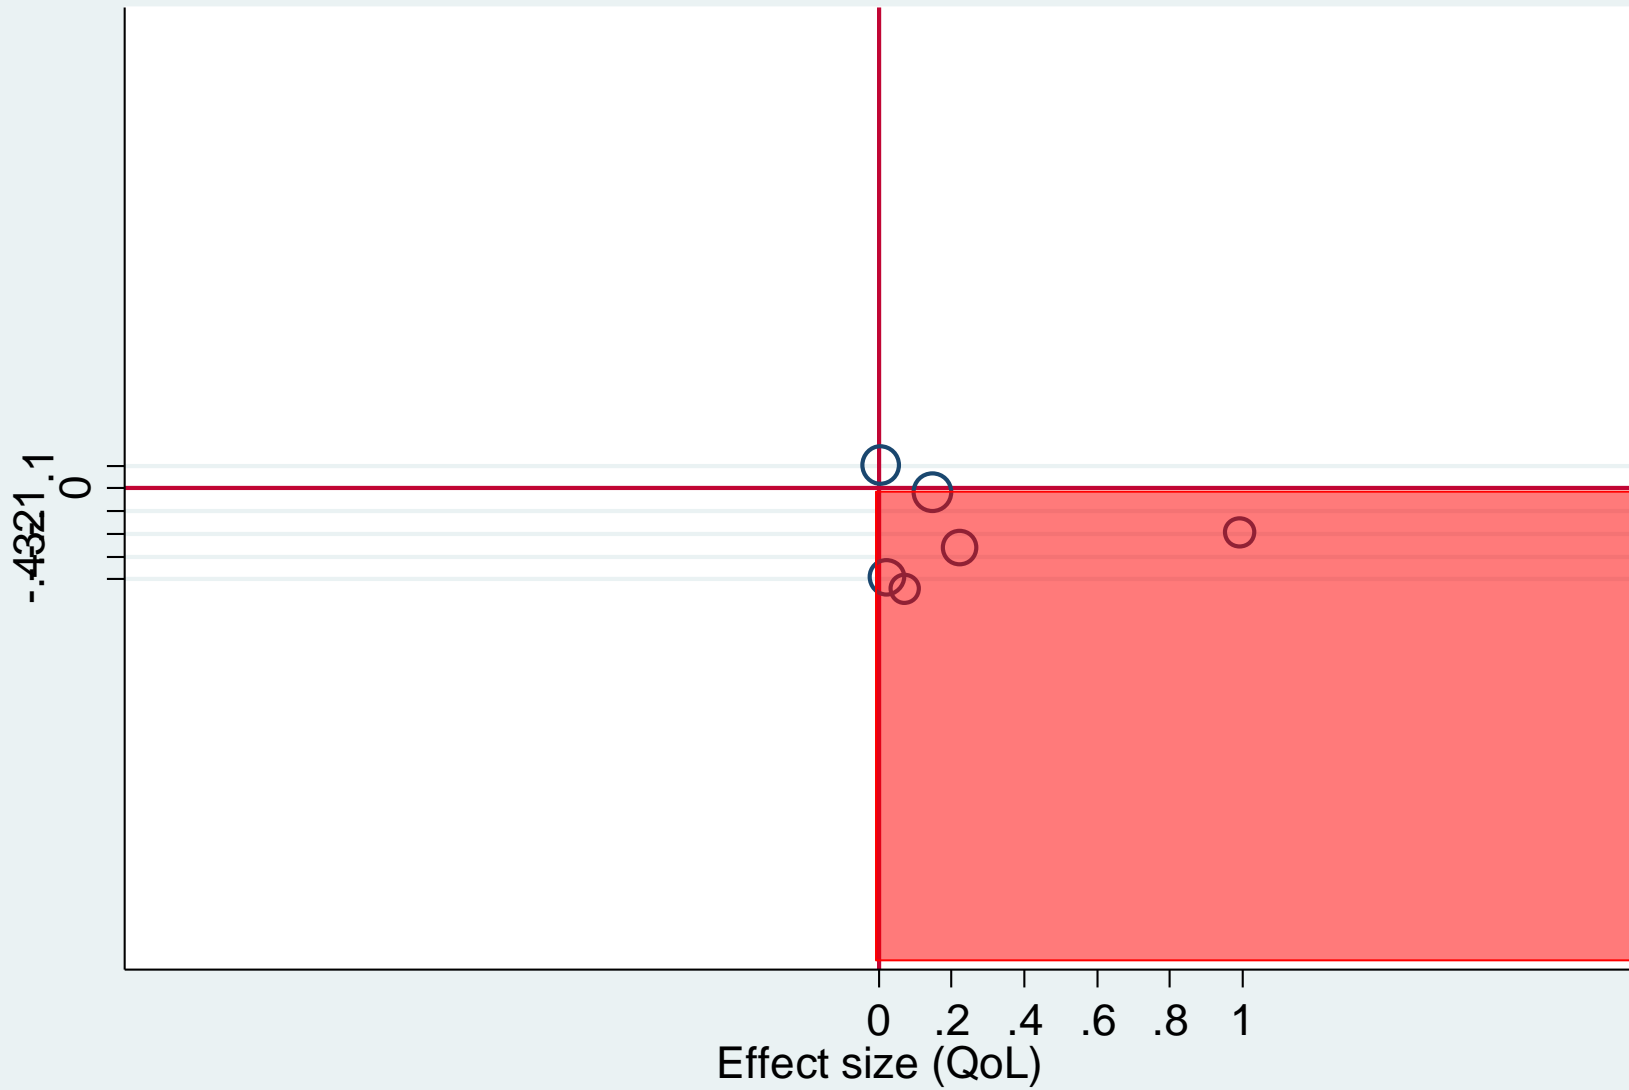

Exemplar analysis – respiratory

Permutation plot - respiratory trials

Permutation plot - respiratory trials total costs

| Included studies | Outcome | ES | 95% CI | N |
|------------------|--------------|-------|----------------|----|

| | | | | |
| 'Self-management' | QoL | 0.19 | 0.10 to 0.27 | 27 |
| | Hospital use | -0.20 | -0.33 to -0.07 | 25 |

Statistically significant benefits of at least 'small' magnitude

| | Combined QoL | SM QoL | CM QoL | Combined hospitalisation | SM hospitalisation | CM hospitalisation |
|---------------|--------------|-------------|-------------|--------------------------|--------------------|--------------------|
| Respiratory | Blue | Blue | White | Blue | Grey dotted | Blue |
| Cardiac | Blue | White | Blue | Blue | Blue | Blue |
| Arthritis | White | White | White | White | White | Blue |
| Pain | White | Grey dotted | White | White | White | White |
| Diabetes | Blue | Blue | White | White | White | White |
| Mental health | Blue | White | Blue | White | White | White |
| Mixed | White | White | Grey dotted | White | White | White |

Groupings

- Variability over time (e.g. pain, depression, IBD)
 - QoL 0.16 (0.10 to 0.23)
 - Hospital -0.04 (-0.12 to 0.03)
- Ongoing with exacerbations (COPD, CHD)
 - QoL 0.27 (0.19 to 0.35)
 - Hospital -0.20 (-0.30 to -0.11)

Conclusions

- Self-management generally did not compromise QoL
- Could lead to small but significant reductions in utilisation
- Interventions in respiratory and cardiac group most consistent

Caveats

- Large numbers of eligible studies
- No clear 'limit' to self-management
- Unknown sensitivity of search
- Lots of 'wastage'

Caveats

- Nature of self-management variable by condition
 - Modest effects may reflect differing aims
- Caution with partial cost outcomes (EPP, WSD)
- Design
 - Impact smaller in better quality studies
 - Impact different in UK studies (smaller QoL, larger impact on hospital use, smaller impact on costs)

Caveats

- Little account of multimorbidity
- Much self-management involves significant ‘initial’ input
- ‘Discrete’ view of self-management as ‘intervention’

Context

- Assumes reduction is appropriate
- Usual design versus usual care NOT a good test?
- Supplier induced demand
